

Project Background

The Camilty Wind Farm is a consented 6 turbine wind farm located near Harburn, West Lothian.

Consent for the wind farm was granted in 2016 by the Scottish Government's Department for Planning and Environmental Appeals (DPEA), under the management of previous project owners Partnership for Renewables (PfR).

EDF Renewables acquired Camilty from PfR in 2017. A thorough review of the project has since been undertaken to look at ways of optimising the site.

This optimisation has focused on four key changes to the consented wind farm design. These are an increase in turbine tip height, an extension to the operational life, a shorter access track and a new point of access from the A70. The location of, and number of, turbines remains unchanged.

The shorter access track and an improved point of access from the A70 have been consented under a previous application (ref: 0311/FUL/20). As such, this consultation focuses on the proposed increase in turbine tip height from 138.5m to 149.9m, and the extension to the operational life, from 25 years to 30 years.

This consultation is seeking views on the proposed changes prior to submitting a planning application to West Lothian Council.
